Dear Hiring Team,

Introduction

I build software that shows its working, so people can trust what it decides. I came to tech from hospitality, where I ran a cafe's ordering system, taught myself Python to automate the stock count, then went back to study computer science. I finished my degree in 2020 and have spent the last two years at Humongous Insurance shipping language model features in production.

I am applying for the AI Engineer role at Fabrikam. Turning unstructured documents into checked, structured data is the work I already do, and doing it for councils and utilities, where the details matter, is what draws me to it.

Why I Am a Good Fit

The role needs production experience with LLM APIs and structured outputs, which I have from building a claims-intake assistant where a model reads customer emails and PDFs and its output is validated against JSON schemas before over 2,000 claims a month are routed. Evaluation is the other half of that work: I built a 300-claim evaluation set and step-by-step tracing, which cut misrouted claims from 9% to 3%. My Python is strong, and I use it for practical tooling such as reconciling supplier invoices against bookings, alongside several years of PostgreSQL. I have also built retrieval over 5,000 recipes with pgvector, which matches the retrieval work you mention.

Additional Information

I currently hold a valid open work visa valid until June 2028. I am available to start work after serving my 2-week notice period.

Kind regards,

Alex Rivera
