Dear Hiring Team,

Introduction

I came to software from hospitality: I ran the ordering system at a busy café, taught myself Python to automate the stock count, then went back to study computer science. That degree led to four years as an engineer, the last two shipping features in production, and I now work as a Software Engineer at Humongous Insurance in Auckland. My guiding principle is simple: software should show its working, so people can trust what it decides.

I am applying for the Frontend Engineer role at Fourth Coffee. You deliver coffee subscriptions to 40,000 homes and offices, and building the app those customers order from every week, with a design system they can rely on, is the work I enjoy most.

Why I Am a Good Fit

The role is built on React and TypeScript, and that is my daily stack: at Humongous Insurance I rebuilt the customer claims portal in Next.js and React and designed the typed APIs behind it. Accessibility and performance matter to me in the same way, so the Margie's Travel booking flow passed WCAG 2.1 AA and the claims portal load time came down from 4.1 seconds to 1.3. Component testing is something I have added where it was missing, bringing Vitest and Playwright into a codebase that had none so regressions were caught before customers saw them. Next.js is the framework I reach for first, and I have used it on the portal and on my own projects.

Additional Information

I currently hold a valid open work visa valid until June 2028. I am available to start work after serving my 2-week notice period.

Kind regards,

Alex Rivera
