Dear Hiring Team,

Introduction

I came to software from hospitality. I ran the ordering system at a busy cafe, taught myself Python to automate the stock count, then went back to study computer science. That is where my working principle came from: make the software show its working, so people can trust what it decides. I have a degree in computer science and four years as a software engineer, the last two at Humongous Insurance in Auckland shipping language model features to production.

I am applying for the Machine Learning Engineer role at Litware. Pasture-growth forecasting for dairy farms, built from satellite imagery and on-farm sensors, is the kind of problem I want to spend my time on. It is why tracing and evaluation matter to me: a forecast a farmer cannot check is a forecast they will not act on.

Why I Am a Good Fit

Litware needs someone who has put models into production, and that is what my last two years have been: my claims-intake assistant reads customer emails and PDFs, checks the output against a schema and routes over 2,000 claims a month, with the evaluation set and tracing that took misrouted claims from 9% to 3%. The work runs on Python, which is what I used at Margie's Travel to write tooling that reconciles supplier invoices, and I work with SQL and PostgreSQL. On the cloud side, I moved four Node.js services to AWS Lambda with GitHub Actions deployments, using S3 along the way. I also spend much of my time explaining model behaviour to people who are not engineers, which is the part of working with agronomists I would enjoy most.

Additional Information

I currently hold a valid open work visa valid until June 2028. I am available to start work after serving my 2-week notice period.

Kind regards,

Alex Rivera
