Dear Hiring Team,

Introduction

I am a software engineer at Humongous Insurance in Auckland, where I have spent the last two years shipping language model features to production. I came to software from hospitality, where I ran a busy café's ordering system and taught myself Python to automate the stock count, then went back to study computer science. My working principle is simple: make the software show its working, so people can trust what it decides.

I would like to apply for the AI Developer role advertised by Proseware Talent. The work described, triaging maintenance requests, answering questions from lease documents and building a reporting assistant people can talk to, is the work I want to keep doing: turning messy text into checked, structured data a product can act on.

Why I Am a Good Fit

The advert asks for recent hands-on work with language models, and mine runs in production: I built a claims-intake assistant that reads customer emails and PDFs, checks its output against JSON schemas, and routes more than 2,000 claims a month. It also asks for TypeScript and Node.js, which is my daily work, and I moved four Node.js services onto AWS Lambda, deployed through GitHub Actions. Retrieval is not new to me either: my recipe planner side project searches 5,000 recipes held in a vector database, with a model that explains each suggestion. The role also covers monitoring model quality in production, which is the part I like most, and a 300-claim evaluation set with step-by-step tracing cut misrouted claims from 9% to 3%.

Additional Information

I currently hold a valid open work visa valid until June 2028. I am available to start work after serving my 2-week notice period.

Kind regards,

Alex Rivera
